

Deworming Schedule:

Severely malnourished or infested horses require special care and should see a veterinarian to receive a custom deworming program designed to kill the parasites off slowly. If a horse has a large number of worms, killing them all off at once can lead to colic or death.

We believe fecal exams are the most important part of your deworming program. Parasites continue to develop resistance to our deworming medications. Horses on regular worming schedules can sometimes be heavily infested due to parasites being resistant to the medication used. These infections can be identified through fecal exams and treated with specially designed deworming programs.

**Foals: 6-8 weeks old:
weeks:**

12-16 weeks old:

18-24

Larvicidal (double dose) of Panacur Ivermectin 1.5 times the adult dose Strongid

24-32 weeks old

32-40 weeks old:

38-48 weeks old:

Ivermectin or Moxidectin with Praziquantal* Panacur double dose Strongid

For tapeworms

1 year old

Ivermectin or Moxidectin with Praziquantal*

After 1 year of age foals can go on an adult deworming rotation. We recommend fecal exams every 60 days on foals to monitor them for parasite infestation.

*** Products containing Praziquantal include Equimax, Quest Plus**
